SINGAPORE-SPECIFIC AI FOR STOREFRONT LEASE DECISIONS

FrontMatter

An AI-powered feasibility platform that turns storefront photos, lease terms, and local Singapore business context into a quantified lease viability score.

Find the opportunity. Measure the risk.
Built for Singapore. Powered by lease economics.

PROBLEM

The storefront is a monthly bet.

Before the first customer walks in, the lease has already started counting.

307	60%	82%
F&B closures / month	closed within five years	never profitable

WORKFLOW

From storefront input to lease decision

Lease Inputs 01
rent · area · budget · business type
structured variables for the model

Spatial AI 02
frontage · layout · visibility · utilities
shop-readiness signals from images

Local Grounding 03
nearby merchants · demand signals · official data
Singapore commercial context

F&B Rule Check 04
water · gas · floor trap · exhaust · approved use
hard operating constraints

Economics Model 05
NPV · IRR · payback · scenarios
rent, traffic, margin, lease term

Decision Report 06
score · risk flags · what-if controls
yes / no / renegotiate

SAMPLE OUTPUT

Lease viability becomes visible

42 / 100

Economically weak under stated assumptions.

- Projected monthly net profit is negative.
- Occupancy cost exceeds safe range.
- Payback is too close to the lease term.

TECHNICAL EDGE

What makes FrontMatter defensible?

Not a chatbot. A quantified lease evaluation engine.

Built for Singapore storefronts: local commercial context, F&B operating constraints, and a proprietary lease economics model work together before a recommendation is made.

01
Vision Layer

Reads storefront and interior photos into a structured spatial blueprint.

- Detects operational fit beyond listing photos.
- Flags missing visual evidence for F&B setup.

frontage · layout · visibility · utilities · interior photos

02
Grounding Layer

Anchors the site in Singapore's real commercial and competitive context.

- Reads surrounding demand and category density.
- Links map evidence to lease assumptions.

nearby merchants · competition · official datasets

03
Rule Layer

Checks hard F&B operating and regulatory constraints before lease commitment.

- Separates "looks suitable" from "can operate."
- Turns infrastructure gaps into cost and risk.

water · power · gas · floor trap · approved use

04
Financial Layer

Turns assumptions into investment-grade risk metrics and stress scenarios.

- Models cash-flow survival under downside cases.
- Shows what rent or traffic must change.

NPV · IRR · breakeven · payback · scenarios

WHY IT WINS

AI describes. Portals list. FrontMatter decides.

Capability	Generic AI	Portals	FrontMatter
Spatial analysis	Description	None	Scored audit
Singapore data	Weak	Listings	Local grounding
F&B readiness	None	None	Rule screening
Financial model	Generic	Static rent	Lease economics

FrontMatter combines local evidence, operational constraints, and quantified downside testing in one report.

CORE MODEL

Self-developed lease economics

Can this lease survive?

Our model links rent, renovation, traffic, ticket size, margin, and lease term into a traceable viability score instead of relying on a single AI-generated opinion.

- Occupancy cost ratio
- Projected cash flow
- Breakeven customers
- Discounted payback
- NPV / IRR
- BASE · DOWN · SEVERE

GO-TO-MARKET

From lease check to site intelligence

ToC	Free feasibility preview for individual F&B entrepreneurs.
Flywheel	User-uploaded storefronts, leases, and outcomes improve the model.
ToB	F&B-ready badge, API integration, and on-premise site selection for chains.
